

ABSTRACT OF THE DISCLOSURE

A cooperative processing apparatus judges that an error has occurred in an image processing apparatus if receiving a processing result indicating occurrence of an error from the image processing apparatus or receiving no processing result from the image processing apparatus in a prescribed time after requesting the image processing apparatus to execute a second service process. The cooperative processing apparatus generates new instruction data by removing execution-completed services from <exec> and attaching, as <log>, instruction data that was effective at the occurrence of the error.
